with ERP
system

User comfort
and intuitive
control

B2A FOREMAN

The application focuses on the work of a foreman in the production. It provides an overview of the current state of production, the option of a simple division of labour without the need for a personal consultation, and technological support for employees. It interconnects people and activities with the ERP, and helps streamline the overall workflow of production processes.

The control is intuitive. To log in, all you need is an active user account and login information/a barcode, or a Beacon Card identifier (Bluetooth 4.0 transmitter).

FUNCTIONALITIES

Work queue

offers an overview of all tasks that await for a specific centre, workplace or production worker.

Production overview

provides a view of the current work in progress in production, and information on individual employees' downtime.

List of production operations

offers an overview of all prescribed operations on the production order.

List of input material, tools and serial numbers

always available in the corresponding production operation detail tab.

Timeline

provides a view of the overall production order life cycle, and the status of individual production substeps. For example, it displays information on the commencement of work, or write-off of production operations.

Write-off of production operations

enables the foreman to write off work for 1-N production workers at 1-M production operations. The data is sent to the ERP in real time.

Assignment of employee to activity

significantly eliminates and speeds up communication between the foreman and the production worker. The work that the foreman divides in their application is immediately displayed in the B2A Workplace application, without the need for a personal consultation.

Production history

allows the user to view all information entered by employees when working on the given manufactured component as part of other production orders.

Start and end of downtime

enables the user to record the foreman's downtime.

Displaying of prescribed production documentation

for every production order, as normally found in production in printed form.

Production operation timeline

similar to the production order timeline, with the difference that it only displays events linked to the given operation.

Employee account

enables the employee to view their time worked and earnings.

Overview of defective piece reports

divided into defective pieces to be resolved, and resolved defective pieces. Detailed information, including any photographs, is displayed after opening the selected record.

The range of all the displayed and entered information for all functions is the subject of the application customisation for the specific solution implementation.
